The 10 minute cervical collar
This is how you make it:

1. Take a sheet of Plastazote. Cut out roughly the outline you need. All you need is a sharp knife; it cuts easily. It is polyethylene foam.

2. Heat it for 5 minutes. (Smith & Nephew will lend you an oven for a trial period, free of charge, until you buy your own. Even then, it will not be expensive.)

3. Apply it directly to the skin and mould it on. It will set in about 30 seconds, yet remain pleasantly resilient. You can easily take it off again if you want to trim one of the edges or round off a corner—or, if it comes to that, heat it again and remould it. There are several different ways of fastening on straps.

The result is a lightweight, firm, ventilated support, that needs no lining or padding. It is soft to the touch, chemically inert, you can take it off and put it on again, and it is washable. From start to finish, made in less than 10 minutes.

If you want to save people’s time in your physical medicine department, start by doing a simple sum. How many cervical collars do you make in a month? How long does each one take?

Plastazote
the time-saver

This coupon will bring you the information you need. Send it off this very day

To Smith & Nephew Limited, Medical Products Group, Welwyn Garden City, Herts.

Orthopaedics: Principles and their Application

Clinical Orthopaedics and Related Research
Editor-in-chief: Marshall R. Urist, M.D.; Editor-in-chief Emeritus: Anthony F. De Palma, M.D.
This well known series consists of six volumes a year, each devoted to a specific topic in orthopaedics. Standing orders may be placed for a minimum of six consecutive volumes at the special price of 60s. each; volumes ordered singly are 90s. each. The following volumes are still available, some only in limited quantities:

- 6 Present-Day Status of Endoprosthesis
- 8 Chronic Hereditary Diseases and Developmental Anomalies
- 11 Orthopaedic Surgery in the Geriatric Patient
- 13 The Hand—Part I
- 14 Recent Advances in Orthopaedic Surgery in Infancy and Childhood
- 15 The Hand—Part II
- 16 The Foot
- 26 Backache in the Aged
- 27 Neurosurgical Problems in Orthopaedics
- 30 Fractures of the Talar Bone
- 31 Osteoarthritis of the Hip Joint and its Management
- 32 Medical-Legal Problems
- 33 Genetics of Congenital Deformity
- 34 Indications and Evaluation of Foot Stabilizations
- 35 Evaluation and Indications of Various Methods of Spine Fusion
- 36 Orthopaedic Surgery in Rheumatoid Arthritis
- 37 Amputations and Prostheses
- 38 Preoperative and Postoperative Management of Musculoskeletal Injuries
- 39 Review of Current Concepts of Myopathies
- 40 Osteogenesis
- 43 Management of Nonunion
- 44 Historical Orthopaedics

- 45 Epidemiology of Orthopaedic Conditions
- 46 Cerebral Palsy—Upper Extremity
- 47 Cerebral Palsy—Lower Extremity
- 48 Slipped Capital Femoral Epiphysis
- 49 Skeletal Manifestations of Disease
- 50 Trauma to the Elbow and Forearm
- 51 Disorders of the Thoracic Outlet Area and their Management
- 52 Bone and Bone Marrow
- 53 Complications of Orthopaedic Surgery
- 54 Typical Orthopaedic Problems
- 55 Fluorides for Better Bones and Teeth
- 56 Robert W. Johnson, Jr., 77th Birthday Celebration
- 57 Rheumatic Manifestations of Systemic Disease
- 58 The Clavicle
- 59 Bone Induction
- 60 Intramedullary Nailing
- 61 Academic Orthopaedics: A Tribute to William T. Green
- 62 Comparative Orthopaedics
- 63 Orthopaedic Management of Stroke
- 64 Skeletal Mineralization
- 65 Metastatic Bone Disease
- 66 The Present Status of Calciphylaxis
- 67 Articular Cartilage in Health and Disease
- 68 The Wrist

"Self-curing acrylic cement is being used more and more in orthopaedic surgery to bond a weight-bearing prosthesis to bone . . . . . ."

(Journal of Bone and Joint Surgery, Nov. 1968)

C.M.W. Bone Cement, which has been used in thousands of patients, is formulated in collaboration with Mr. John Charnley, C.B.E., D.Sc., F.R.C.S., Consultant Orthopaedic Surgeon and Director of Hip Surgery, Wrightington Hospital, near Wigan, for low friction arthroplasty of the hip.

Silastic® Finger Joint Prosthesis (Swanson Design) from DOW CORNING®

Helps restore function to disabled hands • Improves cosmetic appearance • Gives good joint stability • Is physiologically nonreactive to bone and tissue

* One-piece, hinged, intramedullary implant of silicone elastomer with high flexural durability
* Restores joint alignment and function and provides good lateral stability
* Physiologically non-reactive to surrounding bone and soft tissue
* Minimal support required post-operatively permitting rapid rehabilitation to a useful range of movement.

8 sizes available – supplied sterile

Our Harris Plate comes in forty different sizes.

Four displacement variations with ten blade lengths for each.
The arithmetic is easy.
And due to the success of the different displacements, we have decided to offer all forty sizes as a standard range.

Every Compression Plate is made from the most modern, yet well proved materials.
Every one checked and re-checked.
Every one perfect.
We take all the care possible to ensure your operations are simple and successful.

For full details of displacement sizes, blade lengths and instruments write or phone.
We’ll be pleased to send a leaflet or call in to see you.

ETHIFLEX
a name to remember

- KNOT-TYING EASE
- GREATER STRENGTH
- SMOOTH PASSAGE THROUGH TISSUE
- SUSTAINED RESISTANCE TO STRESS

The new name to remember in synthetic materials is ETHIFLEX Teflon Impregnated Sutures. Sutures that tie with unusual ease... knots glide into place... snug down securely... and fray is never a problem.

This non-reactive material passes through tissue with virtually no resistance, it provides superior strength plus unusual handling ease, and thanks to a new braiding process, you get the tensile strength you need without sacrificing the 'hand' you demand.

A complete range of elasticated tubular bandages

For use after the removal of plaster and whenever a support bandage is required. Tubigrip is simple to apply, maintains even pressure and remains comfortably in position. Tubigrip is a long lasting bandage which can be repeatedly washed without losing its elasticity. A full range of 9 sizes is available for hospital use. All sizes are available from the retail chemist in one metre lengths. Half metre and one metre lengths of sizes of G4 (2½) G4X (3) and G5 (4) may be prescribed on EC 10.

NOW AVAILABLE.....

Designed by PROF. MAURICE E. MÜLLER
BERNE, SWITZERLAND

ADVANTAGES

a) No need to remove greater trochanter
b) Stem prosthesis is cobalt-chromium alloy
c) Acetabulum unit is high density polyethylene
d) 32 mm head places less pressure/sq. in. on acetabulum unit than smaller head sizes
e) Three neck sizes available to control degree of tightness of joint
f) Prosthesis designed with curve to facilitate insertion into proximal femur
g) Requires only a few inexpensive instruments for insertion
h) Immediately available throughout the world

LITERATURE

a) Artificial hip joints made from Protasul; Maurice E. Müller
b) Complete catalog of prostheses and instrumentation
c) Price list of prostheses and instrumentation

The versatile right angled air unit places power in the surgeon's hands for the accurate, efficient use of a large range of orthopaedic instruments. The unit is rated at 230 r.p.m. so that the peripheral speed of wide diameter instruments is sufficiently slow to avoid thermal necrosis.¹

Reference
¹HORNER, D. B., M. D., F. A. C. S.
A Self-Powered, Low Speed Surgical Drill; Prevention of Thermal Necrosis.
The Zimmer right angled air unit is an ideal instrument for the preparation of drill holes for screws, insertion of guide pins, reaming of hard cortical bone, hip arthroplasty reaming, hip nailing, trochanteric and intramedullary reaming, single and twin saw cutting and many other techniques. The unit greatly reduces surgery time and many manually operated, time consuming instruments such as braces, hand drills, screwdrivers, rasps, etc., are no longer necessary.

Please write for our booklet on Air and Electric powered instruments.

Melolin is the dry and non-adherent wound dressing that’s at least three times as absorbent as cotton wool. But unlike cotton wool—and gauze, lint etc.—it does not stick, cannot become entangled in granulation tissue. In Melolin, blood and exudate are absorbed through a perforated polyester film into a thick cotton/acrylic fibre pad. It is a unique one-way absorbency system that keeps the wound surface dry. It comes away painlessly.

Melolin is the ideal primary cover for all types of wound. It is available in individually wrapped and sterilised packs, or in bulk. Write for samples and further information.

‘Melolin’ is the registered trade mark of T. J. Smith & Nephew Ltd.

Stryker combines greater safety with precision control of cutting direction — in the new, versatile Impact Osteotome. This micro-pneumatic handpiece has many applications, particularly in rhinoplasty and small bone surgery. The Impact Osteotome is especially helpful in working on thin cortical bone and taking bone grafts. Bunionectomies are almost effortless.

Practical design features include a variable-speed footswitch control; choice of gouges and chisels that mount instantly with a quarter-turn of the collet; and an air exhaust away from area of surgery.

Ask us about the new Stryker Impact Osteotome — part of the 1600 micro-pneumatic powered surgical instrument system.

Write for detailed brochure.

More Holding Power in Cancellous Bone

Here, at last is a larger bone screw. A cancellous bone screw specially designed for use with the Zimmer compression set when plating the lower third of the femur or other large bone fractures. With fewer threads per inch (8 to 11, depending on size) it is designed to hold better than standard bone screws in soft or cancellous bone. Threads are sharpened to be self tapping. The screw can be used alone or with a washer to compress comminuted fragments as in, for example, condylar fractures.

The Zimmer cancellous bone screw is available in two diameters, 22 sizes. A new series of compression plates with larger screw capacity make ideal companions for that “difficult” fixation.

A New Tibia Plateau

The new Sbarbaro Tibia Plateau Prosthesis has given improved function and lasting results in over 250 patients — confirmed in 85% of cases with an average follow-up of 5 years.¹

Following accepted surgical techniques, and the cutting of a trough to seat the prosthesis, the proper-sized prosthesis is selected and fitted into the trough; driver is then set against the skate, and the plateau seated with a small impactor.

Your Zimmer distributor has complete details: sizes, specifications, immediate availability. Just ask him!

ZIMMER, Warsaw, Indiana, U.S.A., Zimmer of Canada, Ltd.
Compression Gaining New Popularity

One reason seems to be the no-nonsense Zimmer Compression Implant and Instrument Set. First of all, an extensive engineering and evaluation period made possible the development of extremely uncomplicated and mechanically-efficient instrumentation. There are very few parts, a fact that reduces operative time. A minimal incision is required with this compression set, which presents itself high in the field for manipulation. All bone plate screws can be tightened and set before compression is removed. This holds the approximation of fragments exactly where the surgeon wants it. Your Zimmer distributor will be happy to demonstrate the popular Zimmer Compression Set. Call him.

ZIMMER • The People Who Really Care
Hypodermic Pins Fractures

Pin a finger or toe with a hypodermic syringe? Yes. With the new Riordan Fixation Pin from Zimmer. It's a modified Kirschner Wire with Luer-lok. Its driver is a standard hypodermic syringe. The pin is double sterile packed ready to use in your office or the ER. In many cases it obviates the necessity to take a patient to the operating room. Ideal for mallet fingers, shaft fractures and epiphyseal separations, (fingers or toes). Now you can carry sterile Riordan Fixation Pins in your instrument case — ready to use at any time. Order some from your Zimmer distributor.

ZIMMER • The People Who Really Care

We’ve Got to Hand it to You!

In the new ZIP — the Zimmer Implant Protector. Each prosthesis leaves our quality control and goes immediately into an autoclavable container where it may remain in a “hands-off” condition until it is implanted. Sizes not used may be returned to storage and autoclaved again and again with less danger of scratching or other damage. Zimmer Implant Protectors stack neatly and conveniently and are easily handled by the nurses. From now on you might say Zimmer has a “hands-off” policy of handing it to you.

ZIMMER • The People Who Really Care

ZIMMER, Warsaw, Indiana, U.S.A., Zimmer of Canada, Ltd.
Spica Opens for Observation

The new Sbarbaro Spica® eliminates the postoperative application of a spiral compression bandage on the hip. Really a time saver, this elastic compression support goes on quickly over the surgical dressing and effectively compresses the involved area.

Velcro closures make the entire Spica easily removable for either a “quick look” or a dressing change. The Sbarbaro Spica is available in four sizes insuring excellent support, perfect fit and comfort to the patient.

Zimmer • The People Who Really Care

*Patent Applied For

Considerable bleeding accompanies the use of bone grafts in spinal fusion. Constant, gentle suction evacuates blood and sanguineous fluid from the operative site, minimizing the formation of hematoma, a frequent complication of such surgery. The Snyder Hemovac removes this fluid effectively with an efficiency not easy to obtain with mere gravity-type drainage during the early period of convalescence. The Snyder Hemovac is an appropriate conclusion to surgery involving medullary bone.
Have You Arch-Fit A Heel Yet?

The Zimmer Arch-Fit Walking Heel has proved to be exceedingly practical. It eliminates part of the plaster build-up in the arch, saving time in the cast room. Provides the patient with a well-cushioned, durable foundation. Non-slip tread gives good traction. Fit one on your next cast. You'll never go back to flat tops.

Fourth Edition 1970
408 pages 720 illustrations £8

Extract from Preface

A perennial criticism of textbooks, even of monographs, is that they are not helpful to the clinician faced with a problem. In this fourth edition changes will be recognised. The text has been subjected to revision, amendment and expansion. It acknowledges that many surgeons work in isolation: practical considerations are paramount. I have continued to record personally the details of meniscectomies, now approaching 8,500, performed in the units in my charge; and this number is an indication of the volume of material on which opinions are based.

New Book 1970
144 pages 77 illustrations 60s.

Contents

Extract from Preface

There is no doubt that acrylic cement in Orthopaedic Surgery is going to be widely used in many different parts of the world; there is equally no doubt that its use by uninformed operators will produce complications which might seriously threaten its reputation and might hold back the progress of science. If criticisms of acrylic cement are to come from this type of source, it is important to have available the main references to research in this field, both in favour and against the main thesis, and this is a worthwhile reason for producing a monograph. I have, therefore, attempted to assemble, as concisely as possible, the information I have gleaned over the eleven years during which I have been implanting self-curing acrylic cement into the hip joint.
Shoulder Lesions

H. F. Moseley
Senior Surgeon and Director of Accident Service, Royal Victoria Hospital; Associate Professor of Surgery, McGill University; Hunterian Professor, and Robert Jones Lecturer, Royal College of Surgeons of England

Third Edition 1969
334 pages 568 illustrations £12

Contents

‘This third edition comes fifteen years after the publication of the second edition and in the interval the author’s ideas have naturally developed and in some cases changed regarding the operative techniques employed and the lines of treatment followed. ‘This work will long retain its outstanding place in works on shoulder joint lesions and will be frequently consulted by every surgeon wishing to enlarge his knowledge on this part of the body. It should be in every orthopaedic surgeon’s library.’

The ONLY Authentic

Charnley PROSTHESIS
FOR LOW-FRICTION ARTHROPLASTY
OF THE HIP-JOINT

Designed by John Charnley, C.B.E., D.Sc., F.R.C.S.,
Consultant Orthopaedic Surgeon and Director of Hip Surgery
at the Wrightington Hospital, Wigan, England.

Available in two designs of FEMORAL PROSTHESIS and
two external sizes of ACETABULAR CUP.

The STANDARD FEMORAL PROSTHESIS, as illustrated
has a stem with a pronounced curvature at the junction
with the neck.

STRAIGHT NARROW STEM type femoral prosthesis
has a head and neck which are identical in shape and size
with the standard prosthesis, but the stem does not possess
the curvature at the junction with the base of the neck.

The STRAIGHT NARROW STEM prosthesis is useful
when converting an osteotomy to a total prosthesis, and in
the revision of a previous arthroplasty, since it will pass
down the track in the cement left by a larger stem.
The polish of the spherical surface of both femoral prostheses
is an optical mirror finish and therefore not measurable in
micro inches.

Two sizes of ACETABULAR CUP are available, large and
small, the latter being 3.2 mm. (\(\frac{1}{4}\)”) smaller in external
diameter and 1.6 mm. (\(\frac{1}{16}\)”) shallower in external depth,
these two sizes are necessary for the suitability of patients.

Each Acetabular Cup is supplied with a CEMENT
RESTRICTOR (Patent applied for), which is essential in
preventing an excessive amount of cement being injected
into the pelvic cavity. The stainless steel wire RESTRICTOR
is made of a specially sized mesh which only allows sufficient
cement to ooze through to augment fixation in the pelvis.
CERTIFICATE OF INSPECTION
The packaging of all AUTHENTIC CHARNLEY
PROSTHESIS will carry such an assurance which states:—

"We know, by inspection of production, that every care has
been taken in the manufacture of the implant to ensure the
highest standard of precision and quality.
Random production samples of the Charnley Femoral
Prosthesis and all production of the acetabular prosthesis
are submitted to the Wrightington Bio-Mechanical
Laboratory for inspection and testing.

Bio-Mechanical Laboratory
Wrightington Hospital,
Wigan, ENGLAND".

The above procedure is essential to ensure that errors in
quality or design are not allowed to develop over the years
through lack of contact between the Wrightington Hospital
and manufacturer.

THACKRAY, LEEDS, ENGLAND has been appointed
sole authorised manufacturer, and granted the sole right to
use the name CHARNLEY with these prostheses and
instruments.

Full descriptive illustrated brochure sent upon request.

P.O. BOX 173 PARK STREET LEEDS LS1 1RQ ENGLAND
For hand, foot, maxillofacial and orthopedic surgery, you can position and hold the bones with one hand and operate the handpiece with the other. The Stryker 1630 Micro-Pneumatic K Wire Driver and Bone Drill combines ease of operation with complete control and feel of the instrument. Speed of 0 to 272 RPM is accurately controlled by the footswitch, freeing the hand for critical movements. The chuck holds the wire when driving forward and automatically releases when retracted to advance more wire.

Three other Stryker accessories are interchangeable with the handpiece — the Colorguide Drill, Automatic Screwdriver and 5/32” Jacob’s Chuck.
